

State Management

Internet Programming II: Lab 5

Addis Ababa Science and Technology University
Department of Software Engineering

Purpose of This Lab

- The purpose of this lab is to:
 - Practice with state management using PHP Cookie
 - Create cookie
 - Retrieve cookie data
 - Delete cookie
 - Practice with state management using PHP Session
 - Create session
 - Retrieve session data
 - Delete session
 - **Before this Lab !!**
 - It's assumed that you have basic understanding of PHP MySQL CRUD operations
 - This practical session highly depends on the previous laboratory sessions.

PHP Cookie

- Create a cookie that will hold and display current time stamp when a user visits a web page
 - Name = log_time
 - Value = current timestamp (formatted)
 - Expire time two minutes
 - It should be secured
 - It should be accessible only through HTTP protocol

PHP Cookie cont'd

- In your **Lab 3** practical session you wrote a web page hit counter to show how many times a page is visited using text counter
 - This time, use PHP cookie to do the same task and
 - The hit count is increased each time the page is visited, but if the user hits the same page with in less than five minutes page hit is not counted as a new visit.
- Modify the hit counter to store information in activity_log table like
 - When the user visited
 - Which pages (e.g. articles, listicles, home...) were visited on the website.

PHP Session

- Create a simple PHP session named “role” in a web page then assign it some value.
 - If the session value is Admin, just print message “Welcome Admin”
 - If the session value is Customer print “Welcome”.

PHP Session cont'd

- Write a common “login” page where a Customer and Admin are required to enter email and password to go to their respective page.
 - If login is successful and logged in user is:
 - Customer, redirect page to “index.php” page
 - Admin, redirect page to “dashboard.php” page
 - If login fails, redirect user to login page with error message
- Make sure the Customer is not allowed to access “dashboard.php” page, the Admin can access all pages

Project

- Add state management to your web app
 - Apply PHP cookie and session concepts
