

Form Handling

Internet Programming II: Lab 4

Addis Ababa Science and Technology University
Department of Software Engineering

Purpose of This Lab

- The purpose of this lab is to:
 - Practice with PHP-MySQL connection and error functions
 - Create database
 - Practice PHP-MySQL CRUD operations
 - **Before this Lab !!**
 - It's assumed that you have basic understanding of PHP from the previous lecture and laboratory sessions
 - It is assumed that you already know and revised SQL

C	Create	Insert	Post
R	Read	Select	Get
U	Update	Update	Patch/Put
D	Delete	Delete	Delete

Connect and Create DB

- Create PHP MySQL connection
 - If a connection is established, display success message. Otherwise display connection error and exit
- Use the connection you established to create database for your course project
 - if database created display success message. Otherwise display MySQL error and exit
- Once you create the database, on a separate PHP file establish a connection. This time, select specifically the databased you have created.
- Save the file as “connection.php”. Then whenever a connection is required, include it in your PHP file using require() function

Query the Database

NOTE: use “connection.php” file for the following queries

- Create ***users*** table and add at least ***name, email, password*** columns
 - Encrypt the password
- Insert one row to ***users*** table using static data in your PHP file
- Insert multiple rows to ***users*** table using static data in your PHP file

Query the Database cont'd

- Insert one row at a time to ***users*** table using dynamic data from HTML form
- Display list of user's *Name* and *Email* address in an HTML table
- Update at least one user email address and display the updated user name and email
 - Use `mysqli_insert_id()` function
- Delete one or more row from “***users***” table
- Refactor the above works and use ***prepared*** queries to improve efficiency

Project

- Create database for you course project
- Make all contents of your web app dynamic by adding data to and/or fetching data from database
- Apply other important features that you know in PHP to your course project
