**“ASSES the ROLE of WOMENS in HOUSEHOLD ECONOMY AND
PUBLIC INCOME GENERATING ACTIVITIES in GURAGHE ZONE
EMDEBIR TOWN”**

BY: ASEBE TESEMA

ADVISOR: ASHENAFI (MSW)

**January, 2021
JIMMA UNIVERSITY**

Abstract

The purpose of the study is to assess the participation of women in public income generating activity in Guraghe zone the case of Emdebir town. The sources of data to the study are both primary and secondary source of information which are collected from respondents and written materials respectively. Simple random sampling will be selects 45 sample respondents from the community. And also using purposive method 3 interview respondents will be selected from the head offices of women s and children affaires. Questionnaire and interview isinstrument to collect the data, and these collected data will be analyze using appropriate statistical tools. The main activities of women are in public task such as making and selling coffee, serving small shopkeeper, and they create a group to form association to redistribute different products like oil, sugar, and others. In other way women have many responsibilities in unpaid domestic activity like training and education of children, preparing food, and fetching water. After this study the researcher recommend the community and public organization should work to encourage and promote governmental policies to gender equality, to encourage the participation of the women in economic, social, and other activities

Acknowledgement

First and for most I will like to praise Almighty God for helping me to complete this research work and also for his endless help throughout my life. I will like to owe my profound gratitude and special thanks to my advisor Ashenafi W. (MSW) for his critical examination, constructive criticism, intellectual support, and guidance on providing constructive comment to make the research.

CHAPTER ONE

1. INTRODUCTION

1.1. Background

In the Africa context for example, Swaziland income-generating activities are mostly carried out by women. This has been found by students on the adult education program of the University of Swaziland, who have to conduct a training program in a community of their choice. Most of the groups reached have been women's groups, Very few men were involved. As a matter of fact, experience has shown that rural women's involvement in income-generating activities is pervasive throughout the third world. Throughout Asia, Africa, and Latin America, women in rural areas are the traders and small merchants. (Avis et al., 1991; Schulz et al., 2001).

Women also contribute greatly to the economies of many developing countries through food and crop production. In Tanzania, for example, women are the backbone of the rural communities; they work the fields and maintain the home, but receive scant rewards. Women, who make up more than half of the country's population of 30 million people plus, find the first hurdle to setting up a business is access to credit. Getting a loan from a commercial bank is a nightmare of form-filling and intrusive questioning. Genahi.G.(2002). Education of women and socio economic development.

A scheme established recently in parts of Tanzania, which is like many others, attempts to help them plough some of the little money they have saved into income-generating projects. Women need loans to be able to conduct and/or participate in income-generating activities. Development Services Office, West Africa, in interviews with women in Upper Volta (USAID, 1978).

Ethiopian context;the situation of women is particularly difficult because of the economic backwardness and serious disadvantage in terms of access to opportunity, a World Bank report gives a graphics profile of the typical Ethiopians women (World Bank, 2011).

The federal democratic governments of Ethiopia has declared its unequivocal commitment to the development of women with the announcement of the national policy on women in 1993

(referred as women's policy), and the proclamation of the new constitution in 1994. The women's policy primary aims to institutionalize the political, economic and social rights of women by creating an appropriate structure in government offices and institutions that the public's policies and investigations are gender sensitive and can ensure equitable development for all Ethiopian men and women (Ethiopian society of population studies, 2009:10)

In Ethiopia, most women's labor economically invisible work around the house and the society recognize household as productive labor, even though a woman has both productive and reproductive role.

Productive role is the actual manufacturing of food, shelter, clothing and household equipment necessary to produce them. Reproductive role/ work is such as bearing children, care giving managing households and educating (socializing) children (Ferrante, 2011).

1.2. Statement of the problem

Women account for roughly half of the world population performed two third of the hour worked, receive one tenth of the world's income and have less than hundredth of the world's property registered in their names. Female deprivation is particularly chronic in developing countries with high level of poverty (Geeta Ganahi, 2002:9).

Women always work in occupation with lower status and playing than men. Much of the employee labors in developing nations, especially in non-industrial sector, is performed by women workers typically toil long hours for low payout contribute significantly with their family income (Charlton 1984:31) Women's plays a crucial role in providing and improving their economy.

Women's are most likely than men to use available resources and skills to further improve the welfare of their family especially nutrition and health aspects (Jackson, 1996:497). Cross culturally the substance contribution of men and women are roughly equal But in domestic activities and child care female labor is predominant. In their subsistence activities and their domestic work women tend work more hours than men do (Kottak, 2004, 36). Women were reported as some of the major constraints hindering the progress of women in

sustainable development in Ethiopia. (United nation, 2002:28) as stated in Gemechu, 2007:28).

The above researchers study is conducted by, in Gemechu, According to his study on the role of women in agricultural economy of household reveals that the study does not touch the challenges and the concepts of domestic activities that women perform during their practice in the house hold. But this research is aims to fill the gap of this previous research.

Additionally this study is hopeful to give some insight in to the role of women s in household economy and domestic activities .And it will also provide information on the gender role, and it help to minimize the care burden falling disproportionately on women and girls through attitudinal and behavioral change.

1.3. Objectives of the Study

1.3.1. General objective of the study

- ✓ The general objective of the study is to assess the situation of women in house hold economy and public income generating activities in Guraghe zone ,Emdebir town

1.3.2. Specific objective

- ✓ To examine the role of women participation in public income generating activity.
- ✓ To find out the challenge in domestic gender relationship due to woman participation in public income genera ting activity.
- ✓ To assess the attitude of society toward woman participation in public income generating activity.

1.4. Significance of the study

The study adds knowledge or societal awareness for the woman s governmental organization, non-governmental organization and also the community through providing information on the woman participation in public income generating activities. The study is also important to discover the gender based role of women and it help to recognize the participation of women and the role of women in the public income generating activity. The study also encourages other researcher to carry out studies in depth that is cover broader aspect of the woman participation in public income generating activity.

Chapter two

2. Review of related literature

2.1. The role of women around the world

Women control the majority of purchasing decisions in the public and their influence is growing. Women across the world are expanding beyond traditional roles to influence decision in the home. The platform of action resulting from the 1955 Beijing world conference on women expanded this concept calling it gender mainstreaming that the application of gender perspective to all legal and social norms and standards to all policy development, research planning, advocacy development implementation and monitoring as a mandate for all members of state (Chant, 1992:32).

Over the years women have entered various traditionally male dominated occupations around the world. In all regions women spend at least twice as much time as men on unpaid public work. Women who are employed spend on the average amount of time on the double burden of paid work and family responsibilities. When unpaid work is taken into account, women's total work hours are longer than men's in all regions. In less developed regions, many women take on a large amount of household chores, their participation rate is not as high as that of women in developed regions. Moreover, women generally work long hours than men (Chant, 2006:17).

2.2. Income-generating Projects

An income-generating activity can be seen as some form of employment whereby participants are involved in activities for the purpose of increasing their income. An income-generating activity includes any self-supporting project where benefits accrue to participants from sale of items for money, from employment for wages, or from increased produce. Types of projects carried out in many countries may vary depending on the situation. For example,

projects may involve planting trees to increase fuel or fodder supply or to conserve soil, thereby improving production in the gardens and fields. In Swaziland, quite a number of women's groups are involved in activities such as sewing, gardening and the manufacture of candles, floor polish and cloth softeners, Vaseline and Vicks. Other products and/or activities termed men's work include the making of bricks (blocks), water reservoirs (small dams) and huge water jars for harvesting water.

While generating increased income is the main thrust in these endeavors, an important aspect is also benefit control. This has happened, for example, in a project like chicken-raising, where women do most of the chores (i.e. carrying water for long distances) but men benefit most from the cooperative because women have no voice in selecting or directing the project or in benefit use. This is more so when a woman brings an income to the household but the husband decides how to spend the money; sometimes not to the benefit of the family or the woman involved. This type of problem can be alleviated where project options consider allowing participants (in this case women) to select and receive community or private goods instead of money, if control of money is denied. (MulatuFerede 2004)

2.3. Women's economic participation and empowerment

Women have the potential to change their own economics status, as that of the communities and countries in which they live. Yet more often than not, women's economic contributions go unrecognized, their work Women's economic empowerment that is their capacity to bring about economic change for themselves is increasingly viewed as the most important contributing factors to achieving equality between women and men. (Charlotte p. Gilman, 1970:182)

Traditionally, women are involved in productive, reproductive and participatory roles. A number of studies indicate that women do about 50-60% of the agricultural work in farming household. Women are the back bone any society and are active in micro and informal sector, which are given little consideration. Their contribution is neither values nor reported Because of the deep-rooted socio cultural practices and their low education status, women have limited access to economic resource such as land, property, credit, financial services and so on and are usually engaged in informal activities.

According to Haddaswolde, the majority of women are engaged in domestic and informal activities, such as provision of fuel and water, child and family care and food processing, which are essential for the survival of households.

These informal and household jobs are unpaid and are generally governed by custom. In this regard, most frequently women are excused from formal sectors. For instance, the federal civil service report of 1997/8 indicates that of the total civil service employees in the country, only 18% are women. About 95% of these women are in clerical and other low paying jobs. Only about 5% are working in administrative and decision making positions. Moreover, the Government and non-governmental organizations (NGOs) are encouraging micro-credit facilities and skills training programmes for women. Such a movement will definitely improve their economic status, but the process is slow [Ayferam G (2015) Assessment of the Roles and Constraints of Women in Economic Development of Ethiopia: The Case of Ambo Town Since 1991. J Pol Sci Pub Aff 3: 148. doi:10.4172/2332-0761.1000148]

2.4. Factors challenging women's economic empowerment

Women are the predominate victims of conflict, sexual violence, injury, death and human trafficking. Because of

- ✓ Lack of adequate access to education, training and technology
- ✓ Lack of access to responsible health care
- ✓ Low level educational background:
- ✓ Lack of initial capital to start their own business:
- ✓ Lack of business know-how:
- ✓ Lack of monitoring women's cooperation activities:
- ✓ Dependency of family on women's:
- ✓ Lack of interest to work in group (cooperation):
- ✓ Women's dependency on men's income:
- ✓ Lack of access to credit or finances
- ✓ Lack of adequate representation in decision making position

[Ayferam G (2015) Assessment of the Roles and Constraints of Women in Economic Development of Ethiopia: The Case of Ambo Town since 1991. J Pol Sci Pub Aff 3: 148. doi:10.4172/2332-0761.1000148]

Chapter three

3. Methods

3.1. Types and sources of data

The data requires for the study includes both primary and secondary sources of data. Because of that the contribution of both sources are effective to accomplish this study.

3.1.1. Primary data

The primary data will obtain from the respondents those are woman, government office, non-governmental organization and community through questionnaire, expert interview and attitudinal scale. Through direct communication with the woman, government office, non-governmental organization and community.

3.1.2. Secondary data

Secondary data are data that already previously collected by another person s/people, The researcher use such type of data in order to get more available information that is related to the case understudy, the secondary data is obtained in through reviewing available literature such as text book, magazines, internets and other written documents.

3.2. Target population and study area

Emdiber town is located in south nation s nationalities and regional state of Ethiopia in Gurage zone. The town located at about 185 K.M far from Addis Ababa the capital city of Ethiopia.

Geographical the town is found at about 8 7N latitude 35 56E longitude. An elevation between 2130 and 2164 meter above sea level, Emdiber is the administrative center of ChehaWoreda. Emdiber town is bordered on the south EnemorinaEaner, on the west by the Oromia region, on the north by the Wabe river which separate it from Abeshege and Kebena, on east by Exha and on the south east by Gumer and Geta. According to 2007 E.C National Census reported this town has a total population of 3,239 of whom 2,103 were men and

1,136 were women. The majority the inhabitants were Orthodox Christian next to Muslim. The town of economy is agriculture and trade activity

3.3. Sample size

Identifying the total population size is the key to determine sample size. The total populations of women who are living in are Guraghe 115,034 particularly Emdebir woman are 1213, In order to get proper and relevant information about the study area; taking adequate sample size to some extent is very essential. Thus the researcher has selected 3 personnel from government administrators who are used for expert interviews and also selected sample of 30 woman s for questionnaire by using simple random sampling method among the total population of 1213 in the study area those respondents were selected from two cooperatives. From these the researcher takes 15 respondents for each cooperative by using fish boll method.(CSA in 2007)

3.4. Sampling technique

Selecting sample size is fundamental for research study, taking probability sampling techniques is better when the total population is small. The target studies are women found in Guraghe particularly Emdebir town. Probability sampling technique is used to select this target studies through simple random sampling by using lottery methods.

Non probability sampling is used when the researcher want to get some ideas of the government office and non-governmental organization in detail with in specified period of time by using purposive/judgmental sampling technique. From non-probability sampling purposive sampling is employed. In this techniques the researcher has decide up on who is include in the sample that can Provided the best information to achieve the objective of the study.

3.5. Data collection tools

In order to obtain adequate information on the issue of the study the researcher is employed through the researcher administered questionnaires and expert interview following the approaches of quantitative and qualitative respectively. For data collection, the researcher used expert interview, researcher -administered questionnaires.

Researcher-administered questions is distributed to the women and expert interview is used to get information in detail from the governmental and non-governmental office. The questions were constitutes both open ended and close ended questions.

Interview the respondents will be interviewed or asked different types of questions in detail and deeply. In other words, the researcher asks research respondents several sorts of questions repeatedly so as to obtain adequate form of information regarding to the objectives of the study that will be addressed. Questionnaire is a research instrument consisting series of questions for the purpose of gathering information from woman
a researcher-administered questionnaire will be distributed to the woman

The questionnaires will be constituted both open ended and close ended questions.

The data was gathered in that quantitative data which was collected from respondents used questionnaires

because the questionnaires have advantage in that they are cheap, not require much effort and often have standardized answer.

3.6. Dataprocessing and analyzing

This portion presents the data analysis, discussionand processing of the study. This is aimed at assessing the participation of woman in public income generating activities. The data presented are collected from 45 respondents by questionnaire and interview conducted with informants.

The analysis of data is done by using the statistical tools such as percentages (%) frequency and tables/pie chart for the quantitative data whereas the qualitative data which are collected through interview is analyzed through content analysis/theoretical analysis. The characteristics to data processing and analyzing are consider according to, age educational status, ethnicity, religious affiliation, and marital status etc.

3.7. Scope of the study

This research is conducted in Guraghe zone Emdebir town which is focus on the situation of woman participation in public income generating activities. Additionally it includes the

challenges that affect the contribution of women to in public income generating activity and the attitudes of society towards the women.

The reason for limiting the study scope is mainly for the purpose of managing of resources and to get relevant data and information with corresponding to a given time and place.
