

Chapter 5

Maturity Models

ure [4] (©[2005] John Wiley).

levels [4] (©[2005] John Wiley).

The 20 key areas are as follows:

Test strategy

Life-cycle model

Moment of involvement

Planning and estimating

Test specification technique

Static test technique

Metrics

Test tools

Test environment

Office environment

Commitment and motivation

Test functions and training

Scope of methodology

Communication

Reporting

Defect management

Test process management

Evaluation

Low-level testing

Capability Maturity Model (CMM)

The CMM is used to assess the maturity level of an organization to develop software products.

Five levels of maturity

Level 1: Initial

Level 2: Repeatable

Level 3: Defined

Level 4: Managed

Level 5: Optimized

Each level is characterized by a set of *key process areas*.

Test Process Improvement (TPI)

A test process is evaluated w.r.t. 20 *key areas*.

The maturity level of a test process is assessed on a scale of 1—13.

The 13 levels of maturity are partitioned into three groups: *controlled, efficient, and optimizing*.

Testing Maturity Model (TMM)

The TMM model gives guidelines concerning how to improve a test process.

The maturity of a testing process is evaluated on a scale of 1—5.

Level 1: Initial

Level 2: Phase Definition

Level 3: Integration

Level 4: Management and Measurement

Level 5: Optimization, Defect Prevention, and Quality Control
