

Form Handling

Internet Programming II: Lab 3

Addis Ababa Science and Technology University
Department of Software Engineering

Purpose of This Lab

- The purpose of this lab is to:
 - Practice with PHP file handling functions
 - `readfile()`, `fopen()`, `fclose()`, `fread()`, `fwrite()`, `fgets()`, `fgetc()`, `feof()`, `unlink()` ...
 - Exercise to manage upload files: `$_FILES`
 - Include a PHP file into another PHP file: `require()`, `include()`
 - **Before this Lab !!**
 - It's necessary to have understanding of basic form handling from the previous lab session
 - You know how to write simple PHP file

File Handling

The quote at the right box is a text document saved as ***sam_harris.txt***

Write a **single line** of PHP code that reads the file and writes it to the output buffer.

If someone doesn't value evidence, what evidence are you going to provide to prove that they should value it? If someone doesn't value logic, what logical argument could you provide to show the importance of logic?

File Handling cont'd

- Write a web page hit counter to show how many times a page is visited so that you can decide which one is most viewed page.
- Hit counters come in different forms, the one you will create here is a text counter
- In a text counter, the current value of the counter is stored in a file and increased each time the page is visited

File Include (Reuse)

- Use the same text counter you have created in the previous slide to appear on all different pages, but the page count should be different for the corresponding pages
 - Rewrite the counter in a function and path different file name for different pages
- Open up your project file and trim out codes of sections that are appearing in more than one page (header, footer, sidebar ...)
- Save these section in a separate PHP file and include them in all required place using `include()` and `require()` function

Upload Files

- Create html form with ***Title*** and ***Upload File*** fields
 - Title: accepts title of the file to be uploaded
 - Upload File: accepts different types of files
- Use the title sent from the user to save the file on the server
- Create a **uploads** directory, inside uploads directory add three more folders **images**, **docs** and **others**
 - If the uploaded file is image, store it inside *images* folder
 - If the uploaded file is document (pdf, MS doc ...), store it inside *docs* folder
 - If the uploaded file is other multimedia (Video or Audio), store it inside *others* folder
 - If the uploaded file is other than the specified types, reject the file and inform the user it's invalid file
- Make sure the user uploads a maximum size of 30MB file
- Make sure that an other image exists or not with similar title in the destination directory
- NOTE: as it's discussed in the class Apache web server allows to upload maximum size of 2MB.
- Increase the maximum file upload size, so that you can upload large file like multimedia files.

Project

- Convert all the pages that are necessarily to be converted to PHP file
- Apply PHP file handling, file upload, include() and require() functions
- Apply other important features that you know in PHP to your course project
